We proceed, therefore, to correct the constants by the Method of Least Squares. Let $(t_1, x_1); (t_2, x_2); \dots; (t_n, x_n)$ be observed pairs of values of t and x . The problem is then to determine a and y in such a way that if t is given $S^2 = a^2 + y^2$ shall be a minimum. In order that a and y shall make a minimum they must satisfy the so-called normal equations: $\frac{\partial S^2}{\partial a} = 0$ and $\frac{\partial S^2}{\partial y} = 0$. These equations may be written as their exact solution in their present form is impracticable on account of their complexity we replace them in the usual way by a system of approximately equivalent linear equations, by making use of the fact that the quantities u , v by which a and y differ from a_0 , y_0 respectively are small compared with a_0 , y_0 . Expanding the logarithms by Maclaurin's series and neglecting terms of the order of uv and v^2 in comparison with those of the order of u and v we have (23) Expressing the natural logarithms in terms of common logarithms we have, putting $u = B_i A_i + v = B_i V_i$, (25) $\log u = \log B_i + \log A_i$ or in the usual notation of the method of least squares $u A A + v A B = K A G$, (20) $u B A + v B B = K B C$. From these equations u and v are readily computed and hence the corrected values $y = a_0 + u$ and $2D y = a_0 + v$ are found. 6. Application Of The Method...
