Whole provinces have often been surveyed and mapped by measuring a single line, and taking angles with a proper instrument, such as the theodolite. Let AB be a base known by exact measurement. If the angles PAB and PBA are observed, which can be easily done if P be visible, whatever be its distance, from the points A and B, the triangle APB is known, as in case 3 of oblique triangles. Thus the lengths AP and PB and the angle between them are known by calculation, and the position of P can be fixed on the map or plan. If the point Q can be observed from any two angles of the triangle APB, Q is found in like manner with P: or if Q be visible only from P, not from A or B, and if PQ...
